| LESSON PLAN 2026-27(WINTER)                                                                                                                               |      |                                                     |                                                                        |                      |                |                      |                                               |
| NAME OF THE TEACHER : DEEPAK KUMAR BARDA, LECT.CSE(STAGE-II)                                                                                              |      |                                                     |                                                                        |                      |                |                      |                                               |
| Subject: <b>DIGITAL ELECTRONICS AND COMPUTER ORGANISATION</b> (Course Code: CSEPC 207/TH4 )                                                               |      |                                                     |                                                                        |                      |                |                      |                                               |
| Program: Diploma in Computer Science and Engineering                                                                                                      |      |                                                     |                                                                        |                      |                |                      |                                               |
| Semester: 3rd                                                                                                                                             |      |                                                     |                                                                        |                      |                |                      |                                               |
| Total Contact Hours: 45                                                                                                                                   |      |                                                     |                                                                        |                      |                |                      |                                               |
| Total Marks: 100                                                                                                                                          |      |                                                     |                                                                        |                      |                |                      |                                               |
| Assessment: Internal Assessment – 30, End Term – 70                                                                                                       |      |                                                     |                                                                        |                      |                |                      |                                               |
| After completion of the course, the students will be able to:                                                                                             |      |                                                     |                                                                        |                      |                |                      |                                               |
| CO1: Define key concepts of digital electronics, including number systems, Boolean algebra, and logic gates.                                              |      |                                                     |                                                                        |                      |                |                      |                                               |
| CO2: Explain the principles behind combinational and sequential circuits, such as multiplexers, flip-flops, and counters, and their applications.         |      |                                                     |                                                                        |                      |                |                      |                                               |
| CO3: Implement simplified logic circuits using Karnaugh Maps and Boolean algebra to solve real-world digital design problems.                             |      |                                                     |                                                                        |                      |                |                      |                                               |
| CO4: Analyze the instruction cycle, memory organization, and processor architecture to evaluate system performance and identify bottlenecks.              |      |                                                     |                                                                        |                      |                |                      |                                               |
| CO5: Design to simulate a basic CPU operation or create a functional digital circuit using the concepts of digital electronics and computer organization. |      |                                                     |                                                                        |                      |                |                      |                                               |
| Period                                                                                                                                                    | Unit | Topic / Sub-Topic                                   | Learning Objectives                                                    | Activity             | Course Outcome | Learning Methodology | Homework                                      |
| 1                                                                                                                                                         | I    | Difference Between Analog and Digital Signals       | Differentiate between continuous and discrete signals.                 | Waveform drawing     | CO1            | Lecture & Visuals    | Read chapter introduction on digital signals. |
| 2                                                                                                                                                         | I    | Number Systems: Binary, Octal, Decimal, Hexadecimal | Identify base values and representations for different number systems. | Concept Mapping      | CO1            | Lecture & Discussion | Write 1-20 in all four number systems.        |
| 3                                                                                                                                                         | I    | Conversion Between Number Systems                   | Calculate equivalent values across different bases.                    | Group Calculation    | CO1            | Problem Solving      | Complete 10 base conversion exercises.        |
| 4                                                                                                                                                         | I    | Binary Arithmetic: Addition & Subtraction           | Execute fundamental binary arithmetic operations.                      | Board Work           | CO1            | Demonstration        | Solve 5 binary addition/subtraction problems. |
| 5                                                                                                                                                         | I    | Binary Arithmetic: Multiplication & Division        | Execute complex binary arithmetic operations.                          | Peer verification    | CO1            | Problem Solving      | Solve 5 binary multiplication problems.       |
| 6                                                                                                                                                         | I    | Boolean Algebra: Basic Operations                   | Define logical AND, OR, NOT mathematically.                            | Truth Table creation | CO1            | Lecture & Demo       | Create truth tables for basic operations.     |
| 7                                                                                                                                                         | I    | Boolean Algebra: Laws                               | Apply Commutative, Associative, and De Morgan's laws.                  | Proof tracing        | CO1            | Lecture              | Memorize standard Boolean laws.               |
| 8                                                                                                                                                         | I    | Boolean Algebra: Simplification                     | Reduce Boolean expressions to minimal forms.                           | Dry Run Exercises    | CO1            | Problem Solving      | Simplify 3 provided Boolean expressions.      |
| 9                                                                                                                                                         | II   | Logic Gates: AND, OR, NOT                           | Construct basic gate logic and truth tables.                           | Circuit sketching    | CO1            | Lecture & Visuals    | Draw basic gate symbols and tables.           |

# LESSON PLAN 3rd sem DIGITAL ELECTRONICS AND COMPUTER ORGANISATION

|    |     |                                                 |                                                                           |                            |          |                      |                                                       |
|----|-----|-------------------------------------------------|---------------------------------------------------------------------------|----------------------------|----------|----------------------|-------------------------------------------------------|
| 10 | II  | Logic Gates: NAND, NOR                          | Explain the concept of universal gates.                                   | Universal gate derivation  | CO1      | Demonstration        | Implement an AND gate using only NAND gates.          |
| 11 | II  | Logic Gates: XOR, XNOR                          | Identify exclusive logic operations and their use cases.                  | Scenario Analysis          | CO1      | Lecture              | Write truth tables for XOR/XNOR.                      |
| 12 | II  | Design & Simplification using Boolean Algebra   | Translate algebraic equations into logic circuit diagrams.                | Whiteboard design          | CO3      | Problem Solving      | Draw a circuit for a given Boolean equation.          |
| 13 | II  | Karnaugh Maps (K-Maps) Basics                   | Map truth tables onto 2 and 3-variable K-Maps.                            | Grid mapping               | CO3      | Demonstration        | Map 2 standard expressions onto K-Maps.               |
| 14 | II  | K-Maps for Simplification (4-variable)          | Group cells to extract simplified Boolean expressions.                    | Grouping Exercise          | CO3      | Problem Solving      | Simplify a 4-variable expression using a K-Map.       |
| 15 | II  | Practical Applications in Real-World Circuits   | Relate logic gates to daily electronic operations (e.g., alarms).         | Brainstorming              | CO1, CO3 | Discussion           | Identify one real-world use of an XOR gate.           |
| 16 | III | Combinational Circuits: Multiplexers            | Describe the data selector function of a MUX.                             | Block diagram sketching    | CO2      | Lecture & Visuals    | Draw a 4-to-1 MUX block diagram.                      |
| 17 | III | Combinational Circuits: Demultiplexers          | Contrast MUX data selection with DEMUX data distribution.                 | Concept Comparison         | CO2      | Demonstration        | Draw a 1-to-4 DEMUX diagram.                          |
| 18 | III | Encoders and Decoders                           | Explain binary translation for I/O lines.                                 | Truth table mapping        | CO2      | Lecture              | Outline the difference between Encoders and Decoders. |
| 19 | III | Sequential Circuits: Intro & SR Flip-Flops      | Differentiate combinational (no memory) and sequential (memory) circuits. | State simulation           | CO2      | Lecture & Demo       | Create a truth table for an SR Flip-Flop.             |
| 20 | III | Flip-Flops: JK, D, T                            | Explain race-around condition and data/toggle operations.                 | State transition tracing   | CO2      | Problem Solving      | Compare the T and D flip-flop functions.              |
| 21 | III | Synchronous Counters                            | Trace clock pulses triggering simultaneous state changes.                 | Timing diagram analysis    | CO2      | Demonstration        | Sketch a basic timing diagram for a counter.          |
| 22 | III | Asynchronous Counters                           | Explain ripple effects in cascaded flip-flops.                            | Output prediction          | CO2      | Lecture & Visuals    | Read textbook chapter on ripple counters.             |
| 23 | III | Registers and Shift Registers: Types and Uses   | Model data storage and lateral data movement (SISO, PIPO).                | Data flow drawing          | CO2      | Problem Solving      | Trace a 4-bit serial shift operation.                 |
| 24 | IV  | Basic Structure of a Computer: CPU, Memory, I/O | Identify the primary hardware components of a system architecture.        | Architecture block diagram | CO4      | Lecture & Discussion | Draw the Von Neumann architecture block.              |

|    |    |                                             |                                                                          |                              |     |                      |                                                       |
|----|----|---------------------------------------------|--------------------------------------------------------------------------|------------------------------|-----|----------------------|-------------------------------------------------------|
| 25 | IV | Instruction Cycle: Fetch                    | Outline how a CPU retrieves an instruction from memory.                  | Step-by-step tracing         | CO4 | Demonstration        | Write out the fetch cycle micro-operations.           |
| 26 | IV | Instruction Cycle: Decode & Execute         | Explain how operations are interpreted and processed by the ALU.         | Flowchart creation           | CO4 | Lecture              | Create a complete fetch-decode-execute flowchart.     |
| 27 | IV | Memory Organization: Types (RAM, ROM)       | Differentiate volatile and non-volatile primary storage.                 | Concept Mapping              | CO4 | Lecture              | List 3 differences between SRAM and DRAM.             |
| 28 | IV | Memory Organization: Cache                  | Explain the principle of locality and speed bridging.                    | Access time calculation      | CO4 | Demonstration        | Read about L1 vs L2 cache speeds.                     |
| 29 | IV | Memory Organization: Virtual Memory         | Describe paging and logical-to-physical address translation.             | Diagram mapping              | CO4 | Lecture & Visuals    | Write a summary of why virtual memory is needed.      |
| 30 | IV | Introduction to Buses: Address and Data Bus | Specify the direction and role of data/address transmission.             | Bus width calculation        | CO4 | Demonstration        | Calculate memory capacity based on address bus width. |
| 31 | IV | Introduction to Buses: Control Bus          | Identify signals required to coordinate hardware timing.                 | System integration map       | CO4 | Problem Solving      | List standard control signals (Read/Write, etc.).     |
| 32 | V  | Intro to Microprocessors & Microcontrollers | Contrast general-purpose processors with task-specific controllers.      | Tech Spec comparison         | CO4 | Lecture & Discussion | Compare specs of a common PC vs an embedded device.   |
| 33 | V  | Basics of Arithmetic Logic Unit (ALU)       | Detail the internal data paths for arithmetic and logic execution.       | Block mapping                | CO4 | Demonstration        | Draw a simplified ALU structural diagram.             |
| 34 | V  | Basics of Control Unit (CU)                 | Explain how timing signals direct ALU and memory operations.             | Signal tracing               | CO4 | Lecture              | Read chapter on Hardwired vs Microprogrammed CUs.     |
| 35 | V  | Instruction Set Architecture (ISA): Intro   | Define the software-hardware interface boundary.                         | Opcode analysis              | CO4 | Problem Solving      | Define opcode and operand formats.                    |
| 36 | V  | RISC vs CISC Architecture                   | Compare Reduced vs Complex instruction sets regarding cycles and memory. | Chart generation             | CO4 | Lecture              | Create a comparison chart for RISC and CISC.          |
| 37 | V  | Pipelining in Processors                    | Model instruction overlap to increase CPU throughput.                    | Pipeline simulation (Stages) | CO4 | Demonstration        | Draw a 4-stage pipeline execution diagram.            |
| 38 | V  | Performance Optimization                    | Evaluate hazards (data, structural, control) that slow down pipelining.  | Bottleneck identification    | CO4 | Problem Solving      | Review notes on pipeline hazards.                     |

|    |    |                                                                 |                                                                           |                       |     |                   |                                                              |
|----|----|-----------------------------------------------------------------|---------------------------------------------------------------------------|-----------------------|-----|-------------------|--------------------------------------------------------------|
| 39 | VI | I/O Devices and Interfaces (Keyboard, Mouse, Printers, Storage) | Map the peripheral connection logic to the main system.                   | Interface mapping     | CO4 | Lecture           | Briefly explain how a keyboard sends a signal.               |
| 40 | VI | Interrupts                                                      | Describe how external hardware commands CPU attention.                    | Flow control tracing  | CO4 | Demonstration     | Differentiate maskable and non-maskable interrupts.          |
| 41 | VI | Direct Memory Access (DMA)                                      | Explain bypassing the CPU for bulk I/O memory transfers.                  | DMA cycle simulation  | CO4 | Lecture & Visuals | Draw a block diagram of a DMA controller.                    |
| 42 | VI | Modern Trends: Multicore Processors                             | Discuss parallel processing on a single chip.                             | Architecture review   | CO4 | Discussion        | Read an article on dual-core vs quad-core CPU scaling.       |
| 43 | VI | GPUs and Embedded Systems                                       | Contrast serial processing (CPU) with parallel graphics processing (GPU). | Spec analysis         | CO4 | Lecture           | Identify where embedded systems are used in cars.            |
| 44 | VI | Mini-Project Prep: Design a Simple Digital Circuit              | Apply Unit II and III concepts to sketch a functional circuit.            | Project Workshop      | CO5 | Project-Based     | Finalize logic diagram for the mini-project.                 |
| 45 | VI | Mini-Project: Simulate Basic CPU Operation                      | Synthesize the instruction cycle concepts into a simulated model.         | Presentation / Review | CO5 | Demonstration     | Submit final mini-project documentation and review for exam. |

|    |   |                           |                                                                          |                              |     |                 |                                                  |
|----|---|---------------------------|--------------------------------------------------------------------------|------------------------------|-----|-----------------|--------------------------------------------------|
| 33 | V | Logic Unit (ALU)          | Detail the internal data paths for arithmetic and logic execution.       | Block mapping                | CO4 | Demonstration   | Draw a simplified ALU structural diagram.        |
| 34 | V | Unit (CU)                 | Explain how timing signals direct ALU and memory operations.             | Signal tracing               | CO4 | Lecture         | Read chapter on Hardwired vs Microprogrammed CU. |
| 35 | V | Architecture (ISA): Intro | Define the software-hardware interface boundary.                         | Opcode analysis              | CO4 | Problem Solving | Define opcode and operand formats.               |
| 36 | V | RISC vs CISC Architecture | Compare Reduced vs Complex instruction sets regarding cycles and memory. | Chart generation             | CO4 | Lecture         | Create a comparison chart for RISC and CISC.     |
| 37 | V | Pipelining in Processors  | Model instruction overlap to increase CPU throughput.                    | Pipeline simulation (Stages) | CO4 | Demonstration   | Draw a 4-stage pipeline execution diagram.       |
| 38 | V | Performance Optimization  | Evaluate hazards (data, structural, control) that slow down pipelining.  | Bottleneck identification    | CO4 | Problem Solving | Review notes on pipeline hazards.                |
